Cochlear implant placement: round window approach

DOUGLAS D. BACKOUS, M.D.

Swedish Neuroscience Institute, Neurosurgery, Seattle, Washington

The indications for cochlear implantation continue to extend to patients with increased levels of residual hearing. Single-sided deafness and tinnitus are currently under various clinical trials as even further expansion of the application of cochlear implant device and programming technology is underway. This video details a round window and hearing preservation approach for cochlear implant placement, and incorporates the most recent advances in surgical technique.

The video can be found here: http://youtu.be/bDqkbboXrU4.
