Microsurgical ligation of spinal arteriovenous fistulae: techniques

CHAD A. TUCHEK, B.S. AND AARON A. COHEN-GADOL, M.D., MSc

Goodman Campbell Brain and Spine and Indiana University Department of Neurological Surgery, Indianapolis, Indiana

Spinal dural arteriovenous fistula (dAVF) is an acquired abnormal arterial-to-venous connection within the spinal dura with a wide range of clinical presentations and natural history. Spinal dAVF occurs when a radicular artery makes a direct anomalous shunt with a radicular vein within the dura of the nerve root sleeve. Spinal dAVFs are the most common vascular malformation of the spine.

The authors present a patient who presented with sudden temporary lower extremity weakness secondary to an L-1 spinal dAVF. The details of microsurgical techniques to disconnect the fistula are discussed in this video.

The video can be found here: [http://youtu.be/F9Kiffs3s6A](http://youtu.be/F9Kiffs3s6A).

**Key Words** • arteriovenous fistula • spinal cord • microsurgical ligation • video
