Combined petrosal approach for petroclival meningioma

Omar Arnaout, MD, and Ossama Al-Mefty, MD

Department of Neurological Surgery, Brigham and Women's Hospital, Harvard School of Medicine, Boston, Massachusetts

The authors present the case of a 56-year-old patient who presented with a large petroclival meningioma and clinical symptoms of brainstem compression and hydrocephalus. The authors describe a two-stage combined petrosal approach for complete resection of the tumor. The nuances of the approach and microsurgical technique are discussed, as well as the radiographic and clinical outcomes.
